sWitch

The easiest way to install and license is by using the aescripts + aeplugins manager
To install a trial you can select 'Add Trial' from the 'Account' menu.

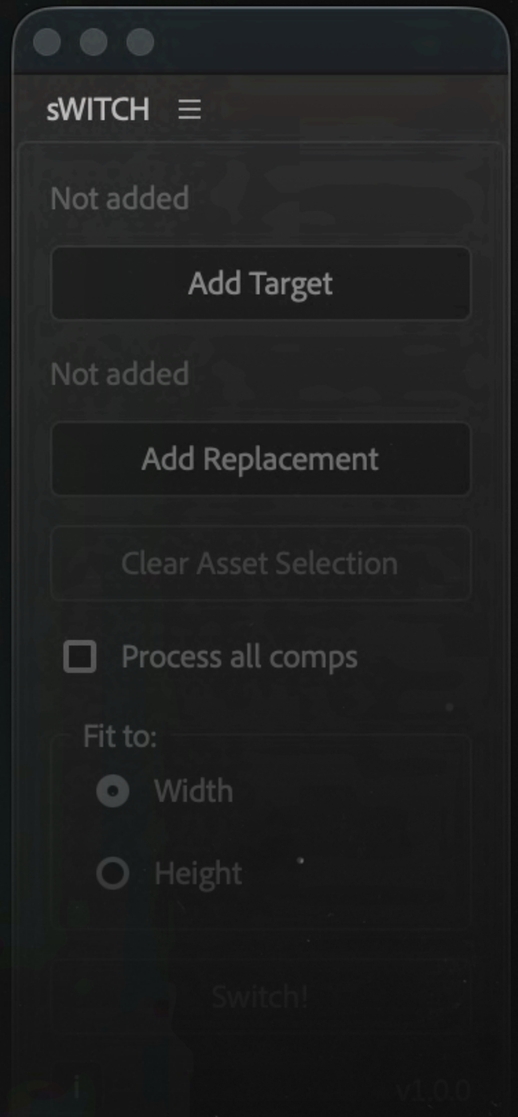

Manual installation:

01. Copy downloaded sWITCH.jsxbin script file to the After Effects Scripts folder.

macOS:
/Applications/Adobe After Effects (version)/Scripts/ScriptUI Panels

Windows:
C:\Program Files\Adobe\Adobe After Effects (version)\Support Files\Scripts\ScriptUI Panels

02. Restart After Effects and you will find sWITCH.jsxbin at the end of the Window menu.

Always save your project before running sWITCH, and test on a duplicate if your project is large, complex, or irreplaceable. Every run is wrapped in a single Undo group, but a fresh save is the simplest safety net against unexpected behaviour — including AE crashes or conflicts with other panels.

sWitch

sWITCH replaces footage and compositions across your After Effects project in one go — automatically adjusting scale, masks, and effects so everything stays visually intact.

1. Select a layer on the timeline or an item in the Project panel, then click **Add Target** to register the asset you want to replace.
2. Select another item and click **Add Replacement** to register what it will be replaced with.
3. Choose **Fit to Width** or **Fit to Height** to control how different aspect ratios are handled.
4. Click **Switch!** to replace in the active composition, or check Process all comps to replace across your entire project.

ⓘ Tips

- Hold **Shift** while clicking **Add Target** or **Add Replacement** to register directly from the Project panel, bypassing any timeline selection.
- **Process all comps** will create 🔒 **Safe folder**. Comps placed in the 🔒 **Safe folder** will prompt for confirmation before processing.
- Use **Clear Asset Selection** to reset and start over. After replacement it will clear automatically.
